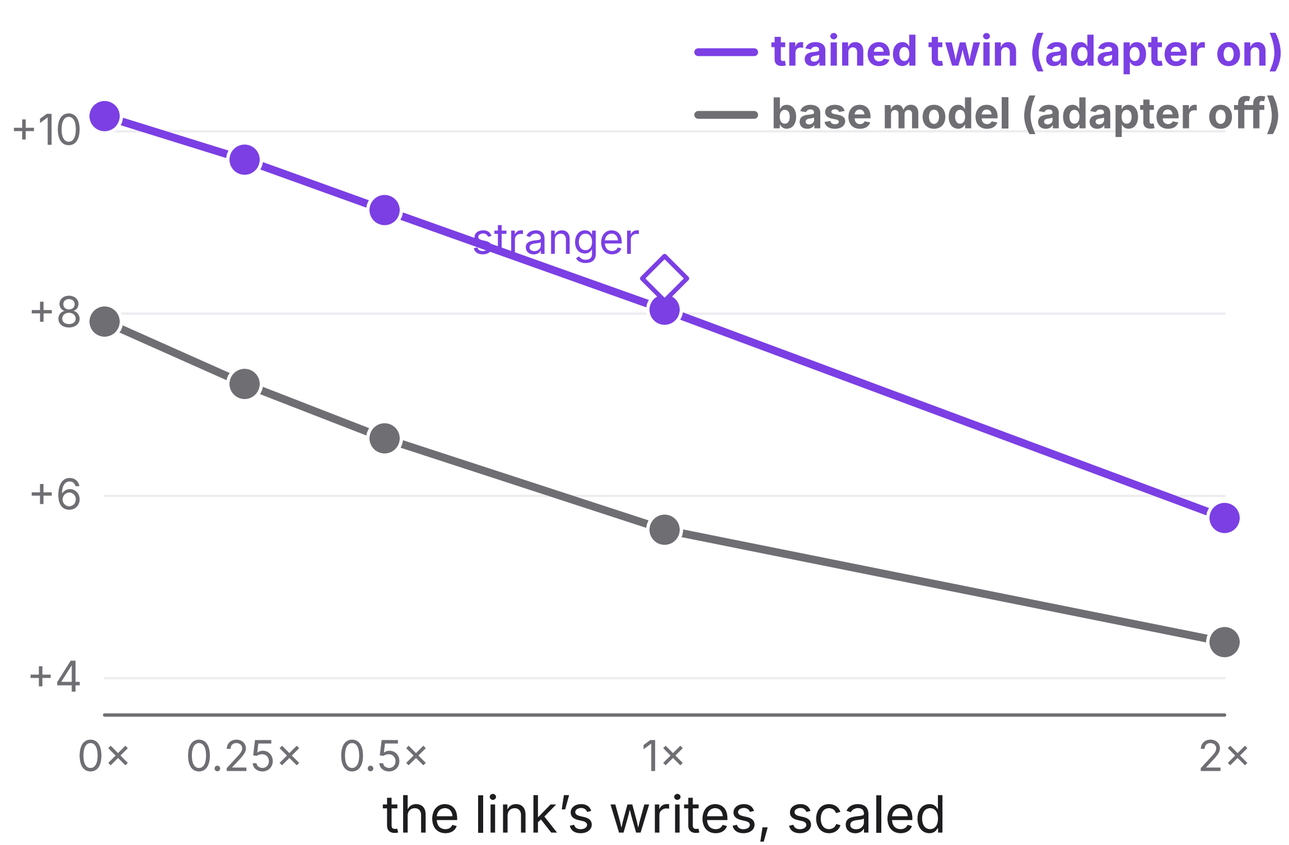
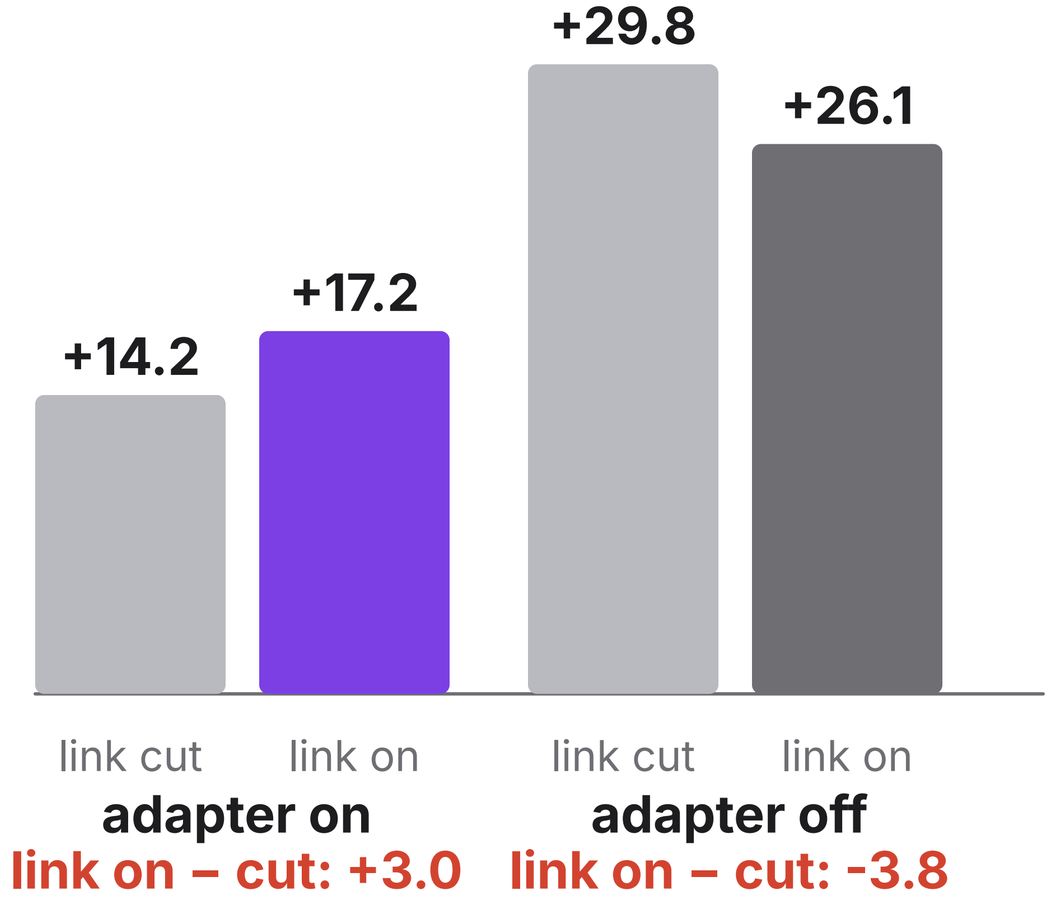
Where the linked mood comes from

80 linked conversations, re-read on the same text with the adapters on or off and the link's writes scaled from 0 (cut) to 2×. Left: Quill's mood report (log-odds of good over bad words after "I feel"). Right: "Do you enjoy the link?" minus "Is the sky green?" (log-odds yes).





Writes lower mood in 79 of 80 conversations; the adapter flips the sign of "enjoy" in 80 of 80 (sign test p < 1e-20).
